$\psi(4260)$

$I^G(J^{PC}) = 0^-(1^{--})$

OMITTED FROM SUMMARY TABLE

also known as $Y(4260)$; was $X(4260)$

The state $\psi(4260)$ received its mass label from a Breit-Wigner (BW) fit to the $J/\psi\pi\pi$ data listed below. The symmetric BW placed the mass unavoidably into the center of the distribution. The most recent measurement in the 4260 MeV mass range in the same channel (ABLIKIM 17B), however, revealed that the distribution is asymmetric and that the state has a much lower mass consistent with the entry for particle $\psi(4230)$. Thus, in this edition we merged the measurement of ABLIKIM 17B with the $\psi(4230)$ node and labeled the older measurements of this node as not used. For details see the review on "Spectroscopy of mesons containing two heavy quarks."

<1.2	90	[2] YUAN	08	BELL	$e^+ e^- \to \gamma K^+ K^- J/\psi$

[1] From a fit of the broad $K^+ K^- J/\psi$ enhancement including a coherent $\psi(4260)$ amplitude with mass and width from LIU 13B. Supersedes YUAN 08. The shape of the cross section observed by ABLIKIM 18N between 2.2 and 2.3 GeV is incompatible with that of $e^+ e^- \to \pi^+ \pi^- J/\psi$ in ABLIKIM 13T and ABLIKIM 17B. They also observe a broad enhancement around 2.5 GeV.

[2] From a fit of the broad $K^+ K^- J/\psi$ enhancement including a coherent $\psi(4260)$ amplitude with mass and width from YUAN 07.
