H^{\pm} (charged Higgs) mass limits for $\mathsf{m}_{H^{\pm}} < \mathsf{m}(\mathsf{top})$

Unless otherwise stated, LEP limits assume B($H^+ \to \tau^+ \nu$)+B($H^+ \to c\overline{s}$)=1, and hold for all values of B($H^+ \to \tau^+ \nu_{\tau}$), and assume H^+ weak isospin of T_3 =+1/2. In the following, $\tan\beta$ is the ratio of the two vacuum expectation values in two-doublet models (2HDM).

The limits are also applicable to point-like technipions. For a discussion of techniparticles, see the Review of Dynamical Electroweak Symmetry Breaking in this Review.

Limits obtained at the LHC are given in the \mathbf{m}_h^{mod-} benchmark scenario, see CARENA 13, and hold for all $\tan\!\beta$ values.

For limits obtained in hadronic collisions before the observation of the top quark, and based on the top mass values inconsistent with the current measurements, see the 1996 (Physical Review **D54** 1 (1996)) Edition of this Review.

Searches in e^+e^- collisions at and above the Z pole have conclusively ruled out the existence of a charged Higgs in the region $m_{H^+} \lesssim 45$ GeV, and are meanwhile superseded by the searches in higher energy e^+e^- collisions at LEP. Results that are by now obsolete are therefore not included in this compilation, and can be found in a previous Edition (The European Physical Journal **C15** 1 (2000)) of this Review.

In the following, and unless otherwise stated, results from the LEP experiments (ALEPH, DELPHI, L3, and OPAL) are assumed to derive from the study of the $e^+e^- \rightarrow H^+H^-$ process. Limits from $b \rightarrow s \gamma$ decays are usually stronger in generic 2HDM models than in Supersymmetric models.

- 1 AAD 15AF search for $t\,\overline{t}$ production followed by $t\to b\,H^+,\,H^+\to \tau^+\nu$ in 19.5 fb $^{-1}$ of $p\,p$ collisions at $E_{\rm cm}=8$ TeV. Upper limits on B($t\to b\,H^+$) B($H^+\to \tau\nu$) between 2.3×10^{-3} and 1.3×10^{-2} (95% CL) are given for $m_{H^+}=80$ –160 GeV. See their Fig. 8 for the excluded regions in different benchmark scenarios of the MSSM. The region $m_{H^+}<140$ GeV is excluded for $\tan\beta>1$ in the considered scenarios.
- 2 KHACHATRYAN 15AX search for $t\,\overline{t}$ production followed by $t\to b\,H^+$, $H^+\to \tau^+\nu$ in 19.7 fb $^{-1}$ of $p\,p$ collisions at $E_{\rm cm}=8$ TeV. Upper limits on B($t\to b\,H^+$) B($H^+\to \tau\nu$) between 1.2×10^{-2} and 1.5×10^{-3} (95% CL) are given for $m_{H^+}=80$ –160 GeV. See their Fig. 11 for the excluded regions in different benchmark scenarios of the MSSM. The region $m_{H^+}<155$ GeV is excluded for $\tan\beta>1$ in the considered scenarios.
- ³ LEP 13 give a limit that refers to the Type II scenario. The limit for B($H^+ \to \tau \nu$) = 1 is 94 GeV (95% CL), and for B($H^+ \to cs$) = 1 the region below 80.5 as well as the region 83–88 GeV is excluded (95% CL). LEP 13 also search for the decay mode $H^+ \to A^0 W^*$ with $A^0 \to b \overline{b}$, which is not negligible in Type I models. The limit in Type I models is 72.5 GeV (95% CL) if $m_{A^0} > 12$ GeV.
- ⁴ ABBIENDI 12 also search for the decay mode $H^+ o A^0 \, W^*$ with $A^0 o b \, \overline{b}$.
- 5 AAD 21V search for $\overline{t}\,b\,H^+$ associated production followed by $H^+\to t\,\overline{b}$ in 139 fb $^{-1}$ of $p\,p$ collisions at $E_{\rm cm}=13$ TeV. See their Fig. 6 for upper limits on cross section times branching ratio for $m_{H^+}=0.2$ –2 TeV. See also their Fig. 7 for the excluded region in the parameter space of the hMSSM and the following MSSM benchmark scenarios: $M_h^{125},\,M_h^{125}(\widetilde{\chi}),\,M_h^{125}(\widetilde{\tau}),\,M_h^{125}({\rm alignment}),\,M_{h_1}^{125}({\rm CPV}).$
- ⁶ SIRUNYAN 21W search for vector boson fusion production of H^+ decaying to $H^+ \to W^+ Z \to \ell^+ \nu \ell^+ \ell^-$ in 137 fb $^{-1}$ of pp collisions at $E_{\rm cm}=13$ TeV. See their Fig. 8 for limits on cross section times branching ratio for $m_{H^+}=0.2$ –3.0 TeV, and also for limits on the fraction of the triplet vev contribution to the W mass in the Georgi-Machacek model.
- ⁷ AAD 20W search for dijet resonances in events with isolated leptons using 139 fb⁻¹ of pp collisions at $E_{\rm cm}=13$ TeV. As a byproduct, $H^+\to t\overline{b}$ produced in association with $\overline{t}b$ is searched for. Limits on the product of cross section times branching ratio for $m_{H^+}=0.6$ –2 TeV are given in their Fig. 5(c).

- ⁸ SIRUNYAN 20AO search for $H^+ \to t \, \overline{b}$ produced in association with t(b) in all jet final states in 35.9 fb⁻¹ of pp collisions at $E_{\rm cm}=13$ TeV. See their Fig. 6 for limits on the product of cross section times branching ratio for $m_{H^+}=0.2$ –3 TeV. Limits for s-channel production are also given for $m_{H^+}=0.8$ –3 TeV. See also Fig. 7 for the corresponding limits in scenarios in the minimal supersymmetric standard model. Cross section limits from combined results with SIRUNYAN 20AV are given in Fig. 8.
- ⁹ SIRUNYAN 20AV search for $H^+ \to t \, \overline{b}$ produced in association with t(b) in final states with one or two leptons, in 35.9 fb $^{-1}$ of pp collisions at $E_{\rm cm}=13$ TeV. See their Fig. 5 for limits on the product of cross section times branching ratio for $m_{H^+}=0.2$ –3 TeV, and their Fig. 6 for the corresponding limits in scenarios in the minimal supersymmetric standard model.
- ¹⁰ SIRUNYAN 20BE search for $t \to bH^+$ followed by the decay $H^+ \to c\overline{s}$ in pair produced top quark events using 35.9 fb⁻¹ of pp collisions at $E_{\rm cm}=13$ TeV. Limits on the branching ratio in the range 1.68–0.25% (95%CL) are given for $m_{H^+}=80$ –160 GeV, see their Fig. 4.
- 11 SIRUNYAN 19AH search for H^+ in the decay of a pair-produced t quark, or in associated $t\,b\,H^+$ or nonresonant $b\,\overline{b}\,H^+\,W^-$ production, followed by $H^+\to\tau^+\nu$, in 35.9 fb $^{-1}$ of $p\,p$ collisions at $E_{\rm cm}=13$ TeV. Upper limits on cross section times branching ratio between 6 pb and 5 fb (95% CL) are given for $m_{H^+}=80$ –3000 GeV (including the non-resonant production near the top quark mass), see their Fig. 6 (left). See their Fig. 6 (right) for the excluded regions in the $m_h^{\rm mod}-$ scenario of the MSSM.
- 12 SIRUNYAN 19BP search for vector boson fusion production of H^+ decaying to $H^+ \to W^+ Z \to \ell^+ \nu \ell^+ \ell^-$ in 35.9 fb $^{-1}$ of $p\,p$ collisions at $E_{\rm cm}=13$ TeV. See their Fig. 7 for limits on cross section times branching ratio for $m_{H^+}=0.3$ –2.0 TeV, and also for limits on the fraction of the triplet vev contribution to the W mass in the Georgi-Machacek model.
- ¹³ SIRUNYAN 19CC search for $t \to bH^+$ from pair produced top quarks, with the decay chain $H^+ \to W^+ A^0$, $A^0 \to \mu^+ \mu^-$ in 35.9 fb $^{-1}$ of pp collisions at $E_{\rm cm}=13$ TeV. See their Fig. 2 for limits on the product of branching ratios for $m_{A^0}=15$ –75 GeV.
- 14 SIRUNYAN 19CQ search for vector boson fusion production of H^+ decaying to $H^+ \to W^+ Z \to \ell^+ \nu \, q \overline{q}$ or $q \, \overline{q} \, \ell^+ \, \ell^-$ in 35.9 fb $^{-1}$ of $p \, p$ collisions at $E_{\rm cm} = 13$ TeV. See their Fig. 5 for limits on cross section times branching ratio for $m_{H^+} = 0.6$ –2.0 TeV, and also for limits on the triplet vacuum expectation value fraction in the Georgi-Machacek model.
- ¹⁵ AABOUD 18BW search for $\overline{t}\,b\,H^+$ associated production or the decay $t\to b\,H^+$, followed by $H^+\to \tau^+\nu$, in 36.1 fb⁻¹ of $p\,p$ collisions at $E_{\rm cm}=13$ TeV. See their Fig. 8(a) for upper limits on cross section times branching ratio for $m_{H^+}=90$ –2000 GeV, and Fig. 8(b) for limits on B($t\to b\,H^+$) B($H^+\to \tau^+\nu$) for $m_{H^+}=90$ –160 GeV. See also their Fig. 9 for the excluded region in the hMSSM parameter space.
- 16 AABOUD 18CD search for $\overline{t}\,b\,H^+$ associated production followed by $H^+\to \,t\,\overline{b}$ in 36.1 fb $^{-1}$ of $p\,p$ collisions at $E_{\rm cm}=13$ TeV. See their Fig. 8 for upper limits on cross section times branching ratio for $m_{H^+}=0.2$ –2 TeV. See also their Fig. 9 for the excluded region in the parameter space of the $m_h^{\rm mod}-$ and hMSSM scenarios of the MSSM. The theory predictions overlaid to the experimental limits to determine the excluded m_{H^+} range are shown without their respective uncertainty band.
- 17 AABOUD 18CH search for vector boson fusion production of H^\pm decaying to $H^\pm \to W^\pm Z \to \ell^\pm \nu \ell^+ \ell^-$ in 36.1 fb $^{-1}$ of pp collisions at $E_{\rm cm}=13$ TeV. See their Fig. 7 for limits on cross section times branching ratio for $m_{H^\pm}=0.2$ –0.9 TeV, and also for limits on the triplet vacuum expectation value fraction in the Georgi-Machacek model.
- ¹⁸ HALLER 18 give 95% CL lower limits on m_{H^+} of 590 GeV in type II two Higgs doublet model from combined data (including an unpublished BELLE result) for B($b \rightarrow s \gamma$).

- ¹⁹ SIRUNYAN 18DO search for $t\overline{t}$ production followed by $t\to bH^+$, $H^+\to c\overline{b}$ in 19.7 fb⁻¹ of pp collisions at $E_{\rm cm}=8$ TeV. See their Fig. 3 for upper limits on B($t\to bH^+$) for $m_{H^+}=90$ –150 GeV assuming that B($H^+\to c\overline{b}$) = 1 and B($t\to bH^+$) + B($t\to bW^+$) = 1.
- ²⁰ MISIAK 17 give 95% CL lower limits on m_{H^+} between 570 and 800 GeV in type II two Higgs doublet model from combined data (including an unpublished BELLE result) for B($b \rightarrow s(d)\gamma$).
- ²¹ SIRUNYAN 17AE search for vector boson fusion production of H^\pm decaying to $H^\pm \to W^\pm Z \to \ell^\pm \nu \ell^+ \ell^-$ in 15.2 fb $^{-1}$ of pp collisions at $E_{\rm cm}=13$ TeV. See their Fig. 3 for limits on cross section times branching ratio for $m_{H^\pm}=0.2$ –2.0 TeV, and also for limits on the triplet vacuum expectation value fraction in the Georgi-Machacek model.
- ²² AABOUD 16A search for t(b) H^\pm associated production followed by $H^+ \to \tau^+ \nu$ in 3.2 fb $^{-1}$ of pp collisions at $E_{\rm cm}=13$ TeV. Upper limits on $\sigma(t(b)$ $H^\pm)$ B($H^+ \to \tau \nu$) between 1.9 pb and 15 fb (95% CL) are given for $m_{H^+}=200$ –2000 GeV, see their Fig. 6. See their Fig. 7 for the excluded regions in the hMSSM scenario.
- ²³ AAD 16AJ search for t(b) H^{\pm} associated production followed by $H^{\pm} \rightarrow tb$ in 20.3 fb⁻¹ of pp collisions at $E_{\rm cm}=8$ TeV. See their Fig. 6 for upper limits on $\sigma(t(b))$ H^{\pm} 0 B($H^{+} \rightarrow tb$) for $m_{H^{+}}=200$ –600 GeV.
- ²⁴ AAD 16AJ search for H^{\pm} production from quark-antiquark annihilation, followed by $H^{\pm} \to tb$, in 20.3 fb⁻¹ of pp collisions at $E_{\rm cm}=8$ TeV. See their Fig. 10 for upper limits on $\sigma(H^{\pm})$ B($H^+ \to tb$) for $m_{H^+}=400$ –3000 GeV.
- ²⁵ AAD 15AF search for $t\,H^\pm$ associated production followed by $H^\pm\to \tau^\pm\nu$ in 19.5 fb⁻¹ of $p\,p$ collisions at $E_{\rm cm}=8$ TeV. Upper limits on $\sigma(t\,H^\pm)$ B($H^+\to \tau\nu$) between 760 and 4.5 fb (95% CL) are given for $m_{H^+}=180$ –1000 GeV. See their Fig. 8 for the excluded regions in different benchmark scenarios of the MSSM.
- AAD 15M search for vector boson fusion production of H^\pm decaying to $H^\pm \to W^\pm Z \to q \overline{q} \ell^+ \ell^-$ in 20.3 fb $^{-1}$ of pp collisions at $E_{\rm cm}=8$ TeV. See their Fig. 2 for limits on cross section times branching ratio for $m_{H^\pm}=200$ –1000 GeV, and Fig. 3 for limits on thetriplet vacuum expectation value fraction in the Georgi-Machacek model.
- 27 KHACHATRYAN 15AX search for tH^\pm associated production followed by $H^\pm\to t\,b$ in 19.7 fb $^{-1}$ of $p\,p$ collisions at $E_{\rm cm}=8$ TeV. Upper limits on $\sigma(t\,H^\pm)$ B($H^+\to t\,\overline{b}$) between 2.0 and 0.13 pb (95% CL) are given for $m_{H^+}=180$ –600 GeV. See their Fig. 11 for the excluded regions in different benchmark scenarios of the MSSM.
- 28 KHACHATRYAN 15 AX search for tH^\pm associated production followed by $H^\pm\to\tau^\pm\nu$ in $^{19.7}$ fb $^{-1}$ of pp collisions at $E_{\rm cm}=8$ TeV. Upper limits on $\sigma(tH^\pm)$ B($H^+\to\tau\nu$) between 380 and 25 fb (95% CL) are given for $m_{H^+}=180$ –600 GeV. See their Fig. 11 for the excluded regions in different benchmark scenarios of the MSSM.
- ²⁹ KHACHATRYAN 15BF search for $t\overline{t}$ production followed by $t\to bH^+$, $H^+\to c\overline{s}$ in 19.7 fb⁻¹ of pp collisions at $E_{\rm cm}=8$ TeV. Upper limits on B($t\to bH^+$) B($H^+\to c\overline{s}$) between 1.2×10^{-2} and 6.5×10^{-2} (95% CL) are given for $m_{H^+}=90$ –160 GeV.
- 30 AAD 14M search for the decay cascade $H_2^0 o H^\pm W^\mp o H^0 W^\pm W^\mp$, H^0 decaying to $b\overline{b}$ in 20.3 fb $^{-1}$ of pp collisions at $E_{\rm cm}=8$ TeV. See their Table III for limits on cross section times branching ratio for $m_{H_2^0}=325-1025$ GeV and $m_{H^+}=225-925$ GeV.
- ³¹ AALTONEN 14A measure B($t \to b \tau \nu$) = 0.096 \pm 0.028 using 9 fb⁻¹ of $p \overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV. For $m_{H^+}=80$ –140 GeV, this measured value is translated to a limit B($t \to b H^+$) < 0.059 at 95% CL assuming B($H^+ \to \tau^+ \nu$) = 1.
- ³² AAD 13AC search for $t\overline{t}$ production followed by $t\to bH^+$, $H^+\to c\overline{s}$ (flavor unidentified) in 4.7 fb⁻¹ of pp collisions at $E_{\rm cm}=7$ TeV. Upper limits on B($t\to bH^+$) between 0.05 and 0.01 (95%CL) are given for $m_{H^+}=90$ –150 GeV and B($H^+\to c\overline{s}$)=1.

- ³³ AAD 13V search for $t\overline{t}$ production followed by $t\to bH^+$, $H^+\to \tau^+\nu$ through violation of lepton universality with 4.6 fb⁻¹ of pp collisions at $E_{\rm cm}=7$ TeV. Upper limits on B($t\to bH^+$) between 0.032 and 0.044 (95% CL) are given for $m_{H^+}=90$ –140 GeV and B($H^+\to \tau^+\nu$) = 1. By combining with AAD 12BH, the limits improve to 0.008 to 0.034 for $m_{H^+}=90$ –160 GeV. See their Fig. 7 for the excluded region in the $m_h^{\rm max}$ scenario of the MSSM.
- ³⁴ AAD 12BH search for $t\,\overline{t}$ production followed by $t\to b\,H^+$, $H^+\to \tau^+\nu$ with 4.6 fb⁻¹ of $p\,p$ collisions at $E_{\rm cm}=7$ TeV. Upper limits on B($t\to b\,H^+$) between 0.01 and 0.05 (95% CL) are given for $m_{H^+}=90$ –160 GeV and B($H^+\to \tau^+\nu$) = 1. See their Fig. 8 for the excluded region in the $m_h^{\rm max}$ scenario of the MSSM.
- ³⁵ CHATRCHYAN 12AA search for $t\overline{t}$ production followed by $t\to bH^+$, $H^+\to \tau^+\nu$ with 2 fb⁻¹ of pp collisions at $E_{\rm cm}=7$ TeV. Upper limits on B($t\to bH^+$) between 0.019 and 0.041 (95% CL) are given for $m_{H^+}=80$ –160 GeV and B($H^+\to \tau^+\nu$)=1.
- ³⁶ AALTONEN 11P search in 2.7 fb $^{-1}$ of $p\overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV for the decay chain $t\to bH^+$, $H^+\to W^+A^0$, $A^0\to \tau^+\tau^-$ with m_{A^0} between 4 and 9 GeV. See their Fig. 4 for limits on B($t\to bH^+$) for 90 $< m_{H^+} < 160$ GeV.
- ³⁷ DESCHAMPS 10 make Type II two Higgs doublet model fits to weak leptonic and semileptonic decays, $b \to s \gamma$, B, B_s mixings, and $Z \to b \, \overline{b}$. The limit holds irrespective of $\tan \beta$.
- ³⁸ AALTONEN 09AJ search for $t \to bH^+$, $H^+ \to c\overline{s}$ in $t\overline{t}$ events in 2.2 fb⁻¹ of $p\overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV. Upper limits on B($t \to bH^+$) between 0.08 and 0.32 (95% CL) are given for $m_{H^+}=60$ –150 GeV and B($H^+ \to c\overline{s}$) = 1.
- ³⁹ ABAZOV 09AC search for $t \to bH^+$, $H^+ \to \tau^+ \nu$ in $t\overline{t}$ events in 0.9 fb⁻¹ of $p\overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV. Upper limits on B($t \to bH^+$) between 0.19 and 0.25 (95% CL) are given for $m_{H^+}=80$ –155 GeV and B($H^+ \to \tau^+ \nu$) = 1. See their Fig. 4 for an excluded region in a MSSM scenario.
- ⁴⁰ ABAZOV 09AG measure $t\,\overline{t}$ cross sections in final states with ℓ + jets (ℓ = e, μ), $\ell\ell$, and $\tau\ell$ in 1 fb⁻¹ of $p\,\overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV, which constrains possible $t\to bH^+$ branching fractions. Upper limits (95% CL) on B($t\to bH^+$) between 0.15 and 0.40 (0.48 and 0.57) are given for B($H^+\to \tau^+\nu$) = 1 (B($H^+\to c\,\overline{s}$) = 1) for $m_{H^+}=80$ –155 GeV.
- ⁴¹ ABAZOV 09AI search for $t \to bH^+$ in $t\overline{t}$ events in 1 fb $^{-1}$ of $p\overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV. Final states with ℓ + jets ($\ell=e,\mu$), $\ell\ell$, and $\tau\ell$ are examined. Upper limits on B($t \to bH^+$) (95% CL) between 0.15 and 0.19 (0.19 and 0.22) are given for B($H^+ \to \tau^+ \nu$) = 1 (B($H^+ \to c\overline{s}$) = 1) for $m_{H^+}=80$ –155 GeV. For B($H^+ \to \tau^+ \nu$) = 1 also a simultaneous extraction of B($t \to bH^+$) and the $t\overline{t}$ cross section is performed, yielding a limit on B($t \to bH^+$) between 0.12 and 0.26 for $m_{H^+}=80$ –155 GeV. See their Figs. 5–8 for excluded regions in several MSSM scenarios.
- 42 ABAZOV 09P search for H^+ production by $q\,\overline{q}'$ annihilation followed by $H^+\to t\,\overline{b}$ decay in 0.9 fb $^{-1}$ of $p\,\overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV. Cross section limits in several two-doublet models are given for $m_{H^+}=180$ –300 GeV. A region with 20 $\lesssim \tan\beta \lesssim$ 70 is excluded (95% CL) for 180 GeV $\lesssim m_{H^+} \lesssim$ 184 GeV in type-I models.
- ⁴³ ABULENCIA 06E search for associated H^0 W production in $p\overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV. A fit is made for $t\overline{t}$ production processes in dilepton, lepton + jets, and lepton + τ final states, with the decays $t\to W^+b$ and $t\to H^+b$ followed by $H^+\to \tau^+\nu$, $c\overline{s}$, $t^*\overline{b}$, or W^+H^0 . Within the MSSM the search is sensitive to the region $\tan\beta<1$ or

- > 30 in the mass range $m_{H^+}=$ 80–160 GeV. See Fig. 2 for the excluded region in a certain MSSM scenario.
- 44 ABDALLAH 04I search for $e^+e^- \rightarrow H^+H^-$ with H^\pm decaying to $\tau\nu$, cs, or W^*A^0 in Type-I two-Higgs-doublet models.
- ⁴⁵ ABBIENDI 03 give a limit $m_{H^+} > 1.28 {\rm tan} \beta$ GeV (95%CL) in Type II two-doublet models.
- ⁴⁶ ABAZOV 02B search for a charged Higgs boson in top decays with $H^+ \to \tau^+ \nu$ at $E_{\rm cm} = 1.8$ TeV. For $m_{H^+} = 75$ GeV, the region $\tan \beta > 32.0$ is excluded at 95%CL. The excluded mass region extends to over 140 GeV for $\tan \beta$ values above 100.
- ⁴⁷ BORZUMATI 02 point out that the decay modes such as $b\overline{b}W$, A^0W , and supersymmetric ones can have substantial branching fractions in the mass range explored at LEP II and Tevatron.
- 48 ABBIENDI 01Q give a limit $\tan\beta/m_{H^+} < 0.53~{\rm GeV}^{-1}$ (95%CL) in Type II two-doublet models
- 49 BARATE 01E give a limit $\tan\!\beta/m_{H^+} < 0.40~{\rm GeV}^{-1}$ (90% CL) in Type II two-doublet models. An independent measurement of $B\to \tau\nu_\tau$ X gives $\tan\!\beta/m_{H^+} < 0.49~{\rm GeV}^{-1}$ (90% CL).
- ⁵⁰ GAMBINO 01 use the world average data in the summer of 2001 B($b \to s \gamma$) = (3.23 \pm 0.42) \times 10⁻⁴. The limit applies for Type-II two-doublet models.
- ⁵¹ AFFOLDER 00I search for a charged Higgs boson in top decays with $H^+ \to \tau^+ \nu$ in $p\overline{p}$ collisions at $E_{\rm cm}=1.8$ TeV. The excluded mass region extends to over 120 GeV for $\tan\beta$ values above 100 and B $(\tau\nu)=1$. If B $(t\to bH^+)\gtrsim$ 0.6, m_{H^+} up to 160 GeV is excluded. Updates ABE 97L.
- ⁵² ABBOTT 99E search for a charged Higgs boson in top decays in $p\overline{p}$ collisions at $E_{\rm cm}=1.8$ TeV, by comparing the observed $t\overline{t}$ cross section (extracted from the data assuming the dominant decay $t\to bW^+$) with theoretical expectation. The search is sensitive to regions of the domains $\tan\beta\lesssim 1$, $50< m_{H^+}({\rm GeV})\lesssim 120$ and $\tan\beta\lesssim 40$, $50< m_{H^+}({\rm GeV})\lesssim 160$. See Fig. 3 for the details of the excluded region.
- ⁵³ ACKERSTAFF 99D measure the Michel parameters ρ , ξ , η , and $\xi\delta$ in leptonic τ decays from $Z \to \tau\tau$. Assuming e- μ universality, the limit $m_{H^+} > 0.97 \tan\beta$ GeV (95%CL) is obtained for two-doublet models in which only one doublet couples to leptons.
- ⁵⁴ ACCIARRI 97F give a limit $m_{H^+}>2.6~{\rm tan}\beta$ GeV (90% CL) from their limit on the exclusive $B\to \tau \nu_{\tau}$ branching ratio.
- ⁵⁵ AMMAR 97B measure the Michel parameter ρ from $\tau \to e \nu \nu$ decays and assumes e/μ universality to extract the Michel η parameter from $\tau \to \mu \nu \nu$ decays. The measurement is translated to a lower limit on m_{H^+} in a two-doublet model $m_{H^+} > 0.97 \tan \beta$ GeV (90% CL).
- ⁵⁶COARASA 97 reanalyzed the constraint on the $(m_{H^\pm}, \tan\beta)$ plane derived from the inclusive $B \to \tau \nu_{\tau} X$ branching ratio in GROSSMAN 95B and BUSKULIC 95. They show that the constraint is quite sensitive to supersymmetric one-loop effects.
- ⁵⁷ GUCHAIT 97 studies the constraints on m_{H^+} set by Tevatron data on $\ell \tau$ final states in $t \bar{t} \to (W b) (H b), W \to \ell \nu, H \to \tau \nu_{\tau}$. See Fig. 2 for the excluded region.
- 58 MANGANO 97 reconsiders the limit in ACCIARRI 97F including the effect of the potentially large $B_{c}\to~\tau\nu_{\tau}$ background to $B_{u}\to~\tau\nu_{\tau}$ decays. Stronger limits are obtained.
- ⁵⁹ STAHL 97 fit τ lifetime, leptonic branching ratios, and the Michel parameters and derive limit $m_{H^+} > 1.5 \tan \beta$ GeV (90% CL) for a two-doublet model. See also STAHL 94.
- ⁶⁰ ALAM 95 measure the inclusive $b \to s \gamma$ branching ratio at $\Upsilon(4S)$ and give B($b \to s \gamma$)< 4.2×10^{-4} (95% CL), which translates to the limit $m_{H^+} > [244 + 63/(\tan\beta)^{1.3}]$ GeV in the Type II two-doublet model. Light supersymmetric particles can invalidate this bound
- 61 BUSKULIC 95 give a limit $m_{H^+} > 1.9 \tan\beta$ GeV (90% CL) for Type-II models from $b \to \tau \nu_{\tau} X$ branching ratio, as proposed in GROSSMAN 94.

$^ H^\pm$ (charged Higgs) mass limits for ${\sf m}_{H^\pm} > {\sf m}({\sf top})$ $^-$

Limits obtained at the LHC are given in the \mathbf{m}_h^{mod-} benchmark scenario, see CARENA 13, and depend on the $\tan\beta$ values.

 $^{^1}$ AABOUD 18BW search for $\overline{t}\,bH^+$ associated production in 36.1 fb $^{-1}$ of $p\,p$ collisions at $E_{\rm cm}=13$ TeV. See also their Fig. 9 for the excluded region in the hMSSM parameter space.

$-H^{\pm\pm}$ (doubly-charged Higgs boson) mass limits

This section covers searches for a doubly-charged Higgs boson with couplings to lepton pairs. Its weak isospin T_3 is thus restricted to two possibilities depending on lepton chiralities: $T_3(H^{\pm\pm})=\pm 1$, with the coupling $g_{\ell\ell}$ to $\ell_L^-\ell_L^{\prime-}$ and $\ell_R^+\ell_R^{\prime+}$ ("left-handed") and $T_3(H^{\pm\pm})=0$, with the coupling to $\ell_R^-\ell_R^{\prime-}$ and $\ell_L^+\ell_L^{\prime+}$ ("right-handed"). These Higgs bosons appear in some left-right symmetric models based on the gauge group $\mathrm{SU}(2)_L \times \mathrm{SU}(2)_R \times \mathrm{U}(1)$, the type-II seesaw model, and the Zee-Babu model. The two cases are listed separately in the following. Unless noted, one of the lepton flavor combinations is assumed to be dominant in the decay.

 $^{^1}$ AABOUD 19K search for pair production of $H^{++}H^{--}$ followed by the decay $H^{\pm\pm}\to W^\pm W^\pm$ in 36.1 fb $^{-1}$ of $p\,p$ collisions at $E_{\rm cm}=13$ TeV. The search is interpreted in a doublet-triplet extension of the scalar sector with a vev of 0.1 GeV, leading to B($H^{\pm\pm}\to W^\pm W^\pm)=1$. See their Fig. 5 for limits on the cross section for $m_{H^{++}}$ between 200 and 700 GeV.

² See their Figs. 11(b) and 13 for limits with smaller branching ratios.

³AAD 15AG search for $H^{++}H^{--}$ production in 20.3 fb⁻¹ of pp collisions at $E_{\rm cm}=8$ TeV. The limit assumes 100% branching ratio to the specified final state. See their Fig. 5 for limits for arbitrary branching ratios.

⁴AAD 15AP search for $H^{++}H^{--}$ production in 20.3 fb⁻¹ of pp collisions at $E_{\rm cm}=8$ TeV. The limit assumes 100% branching ratio to the specified final state. ⁵CHATRCHYAN 12AU search for $H^{++}H^{--}$ production with 4.9 fb⁻¹ of pp collisions at

⁵ CHATRCHYAN 12AU search for $H^{++}H^{--}$ production with 4.9 fb⁻¹ of pp collisions at $E_{\rm cm}=7$ TeV. The limit assumes 100% branching ratio to the specified final state. See their Table 6 for limits including associated $H^{++}H^{-}$ production or assuming different scenarios.

⁶ ABDALLAH 03 search for $H^{++}H^{--}$ pair production either followed by $H^{++} \rightarrow \tau^+\tau^+$, or decaying outside the detector.

- ⁷ ABBIENDI 02C searches for pair production of $H^{++}H^{--}$, with $H^{\pm\pm}\to \ell^{\pm}\ell^{\pm}$ ($\ell,\ell'=e,\mu,\tau$). The limit holds for $\ell=\ell'=\tau$, and becomes stronger for other combinations of leptonic final states. To ensure the decay within the detector, the limit only applies for $g(H\ell\ell)\gtrsim 10^{-7}$.
- ⁸ AAD 21U search for pair production of $H^{++}H^{--}$ followed by the decay $H^{\pm\pm}\to W^\pm W^\pm$ in 139 fb $^{-1}$ of pp collisions at $E_{\rm cm}=13$ TeV. The search is interpreted in a triplet extension of the SM Higgs sector with a triplet vev of 0.1 GeV, leading to ${\rm B}(H^{\pm\pm}\to W^\pm W^\pm)=1$. See their Fig. 9(a) for limits on the cross section for $m_{H^{++}}$ between 200 and 600 GeV.
- ⁹ AAD 21U search for associated production of $H^{\pm\pm}H^{\mp}$ followed by the decays $H^{\pm\pm}\to W^{\pm}W^{\pm}$, $H^{\pm}\to W^{\pm}Z$ in 139 fb $^{-1}$ of pp collisions at $E_{\rm cm}=13$ TeV. $H^{\pm\pm}$ and H^{\pm} are assumed to be degenerate in mass within 5 GeV. The search is interpreted in a triplet extension of the SM Higgs sector with a triplet vev of 0.1 GeV, leading to B($H^{\pm\pm}\to W^{\pm}W^{\pm}$) = 1. See their Fig. 9(b) for limits on the cross section for $m_{H^{++}}$ between 200 and 600 GeV.
- 10 SIRUNYAN 21W search for vector boson fusion production of $H^{\pm\pm}$ decaying to $H^{\pm\pm}\to W^\pm W^\pm\to \ell^\pm\nu\ell^\pm\nu$ in 137 fb $^{-1}$ of pp collisions at $E_{\rm cm}=13$ TeV. See their Fig. 8 for limits on cross section times branching ratio for $m_{H^{++}}=0.2$ –3.0 TeV.
- ¹¹ SIRUNYAN 19CQ search for $H^{\pm\pm}$ production by vector boson fusion followed by the decay $H^{\pm\pm} \to W^\pm W^\pm \to q q \ell \nu$ in 35.9 fb⁻¹ of p p collisions at $E_{\rm cm} = 13$ TeV. See their Fig. 5 for limits on cross section times branching ratio for $m_{H^{\pm\pm}}$ between 0.6 and 2 TeV.
- ¹² SIRUNYAN 18CC search for $H^{\pm\pm}$ production by vector boson fusion followed by the decay $H^{\pm\pm} \to W^\pm W^\pm$ in 35.9 fb⁻¹ of pp collisions at $E_{\rm cm}=13$ TeV. See their Fig. 3 for limits on cross section times branching ratio for $m_{H^{\pm\pm}}$ between 200 and 1000 GeV
- ¹³ KANEMURA 15 examine the case where H^{++} decays preferentially to $W^{(*)}$ $W^{(*)}$ and estimate that a lower mass limit of \sim 84 GeV can be derived from the same-sign dilepton data of AAD 15AG if H^{++} decays with 100% branching ratio to $W^{(*)}$ $W^{(*)}$.
- ¹⁴ KHACHATRYAN 15D search for $H^{\pm\pm}$ production by vector boson fusion followed by the decay $H^{\pm\pm} \to W^{\pm}W^{\pm}$ in 19.4 fb⁻¹ of pp collisions at $E_{\rm cm}=8$ TeV. See their Fig. 4 for limits on cross section times branching ratio for $m_{H^{++}}$ between 160 and 800 GeV.
- ¹⁵ KANEMURA 14 examine the case where H^{++} decays preferentially to $W^{(*)}W^{(*)}$ and estimate that a lower mass limit of \sim 60 GeV can be derived from the same-sign dilepton data of AAD 12CY.
- ¹⁶ AAD 13Y search for $H^{++}H^{--}$ production in a generic search of events with three charged leptons in 4.6 fb⁻¹ of pp collisions at $E_{\rm cm}=7$ TeV. The limit assumes 100% branching ratio to the specified final state.
- ¹⁷ AAD 12AY search for $H^{++}H^{--}$ production with 1.6 fb⁻¹ of pp collisions at $E_{\rm cm}=7$ TeV. The limit assumes 100% branching ratio to the specified final state.
- ¹⁸ AAD 12CQ search for $H^{++}H^{--}$ production with 4.7 fb⁻¹ of pp collisions at $E_{\rm cm}=7$ TeV. The limit assumes 100% branching ratio to the specified final state. See their Table 1 for limits assuming smaller branching ratios.
- 19 ABAZOV 12A search for $H^{++}H^{--}$ production in 7.0 fb $^{-1}$ of $p\overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV.
- ²⁰ AALTONEN 11AF search for $H^{++}H^{--}$ production in 6.1 fb⁻¹ of $p\overline{p}$ collisions at $E_{\rm cm}$ = 1.96 TeV.
- ²¹ AALTONEN 08AA search for $H^{++}H^{--}$ production in $p\overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV. The limit assumes 100% branching ratio to the specified final state.
- ²² ABAZOV 08V search for $H^{++}H^{--}$ production in $p\overline{p}$ collisions at $E_{\rm cm}=$ 1.96 TeV. The limit is for B($H\to\mu\mu$) = 1. The limit is updated in ABAZOV 12A.
- ²³ AKTAS 06A search for single $H^{\pm\pm}$ production in ep collisions at HERA. Assuming that H^{++} only couples to $e^+\mu^+$ with $g_{e\mu}=0.3$ (electromagnetic strength), a limit

- $m_{H^{++}} >$ 141 GeV (95% CL) is derived. For the case where H^{++} couples to $e\tau$ only the limit is 112 GeV.
- the limit is 112 GeV. 24 ACOSTA 05L search for $H^{++}H^{--}$ pair production in $p\overline{p}$ collisions. The limit is valid for $g_{\ell \, \ell'} < 10^{-8}$ so that the Higgs decays outside the detector.
- ²⁵ ABAZOV 04E search for $H^{++}H^{--}$ pair production in $H^{\pm\pm}\to\mu^\pm\mu^\pm$. The limit is valid for $g_{\mu\mu}\gtrsim 10^{-7}$.
- ABBIENDI 03Q searches for single $H^{\pm\pm}$ via direct production in $e^+e^- \rightarrow e^\mp e^\mp H^{\pm\pm}$, and via t-channel exchange in $e^+e^- \rightarrow e^+e^-$. In the direct case, and assuming B($H^{\pm\pm} \rightarrow \ell^\pm \ell^\pm$) = 1, a 95% CL limit on h_{ee} < 0.071 is set for $m_{H^{\pm\pm}}$ < 160 GeV (see Fig. 6). In the second case, indirect limits on h_{ee} are set for $m_{H^{\pm\pm}}$ < 2 TeV (see Fig. 8).
- 27 GORDEEV 97 search for muonium-antimuonium conversion and find $G_{M\,\overline{M}}/G_F < 0.14$ (90% CL), where $G_{M\,\overline{M}}$ is the lepton-flavor violating effective four-fermion coupling. This limit may be converted to $m_{H^{++}} > 210$ GeV if the Yukawa couplings of H^{++} to ee and $\mu\mu$ are as large as the weak gauge coupling. For similar limits on muonium-antimuonium conversion, see the muon Particle Listings.
- 28 ASAKA 95 point out that H^{++} decays dominantly to four fermions in a large region of parameter space where the limit of ACTON 92M from the search of dilepton modes does not apply.
- ²⁹ ACTON 92M limit assumes $H^{\pm\pm} \rightarrow \ell^{\pm}\ell^{\pm}$ or $H^{\pm\pm}$ does not decay in the detector. Thus the region $g_{\ell\ell} \approx 10^{-7}$ is not excluded.
- $^{30}\,\text{ACTON}$ 92M from $\Delta\Gamma_Z<\!40$ MeV.
- 31 SWARTZ 90 assume $H^{\pm\pm}\to\ell^{\pm}\ell^{\pm}$ (any flavor). The limits are valid for the Higgs-lepton coupling g(H\$\ell\$\ell\$\ell\$\ell\$) $\gtrsim 7.4\times10^{-7}/[m_H/\text{GeV}]^{1/2}$. The limits improve somewhat for ee and $\mu\mu$ decay modes.

- ¹See their Figs. 12(b) and 14 for limits with smaller branching ratios.
- ²AAD 15AG search for $H^{++}H^{--}$ production in 20.3 fb⁻¹ of pp collisions at $E_{\rm cm}=8$ TeV. The limit assumes 100% branching ratio to the specified final state. See their Fig. 5 for limits for arbitrary branching ratios.
- 3 AAD 15AP search for $H^{++}H^{--}$ production in 20.3 fb $^{-1}$ of pp collisions at $E_{\rm cm}=8$ TeV. The limit assumes 100% branching ratio to the specified final state.
- ⁴ABDALLAH 03 search for $H^{++}H^{--}$ pair production either followed by $H^{++} \rightarrow \tau^+\tau^+$, or decaying outside the detector.
- ⁵ ACHARD 03F search for $e^+e^- \to H^{++}H^{--}$ with $H^{\pm\pm} \to \ell^\pm \ell'^\pm$. The limit holds for $\ell=\ell'=\tau$, and slightly different limits apply for other flavor combinations. The limit is valid for $g_{\ell\,\ell'} \gtrsim 10^{-7}$.
- ⁶ ABBIENDI 02C searches for pair production of $H^{++}H^{--}$, with $H^{\pm\pm}\to \ell^{\pm}\ell^{\pm}$ ($\ell,\ell'=e,\mu,\tau$). the limit holds for $\ell=\ell'=\tau$, and becomes stronger for other combinations of leptonic final states. To ensure the decay within the detector, the limit only applies for $g(H\ell\ell)\gtrsim 10^{-7}$.
- 7 AAD 12AY search for $H^{++}H^{--}$ production with 1.6 fb $^{-1}$ of pp collisions at $E_{\rm cm}=7$ TeV. The limit assumes 100% branching ratio to the specified final state.
- ⁸ AAD 12CQ search for $H^{++}H^{--}$ production with 4.7 fb⁻¹ of pp collisions at $E_{\rm cm}=7$ TeV. The limit assumes 100% branching ratio to the specified final state. See their Table 1 for limits assuming smaller branching ratios.
- 9 ABAZOV 12A search for $H^{++}H^{--}$ production in 7.0 fb $^{-1}$ of $p\overline{p}$ collisions at $E_{\rm cm}=1.96$ TeV.
- ¹⁰ AALTONEN 11AF search for $H^{++}H^{--}$ production in 6.1 fb⁻¹ of $p\overline{p}$ collisions at $E_{\rm cm}$ = 1.96 TeV.
- ¹¹ ABAZOV 08V search for $H^{++}H^{--}$ production in $p\bar{p}$ collisions at $E_{\rm cm}=$ 1.96 TeV. The limit is for B($H\to\mu\mu$) = 1. The limit is updated in ABAZOV 12A.
- 12 AKTAS 06A search for single $H^{\pm\pm}$ production in ep collisions at HERA. Assuming that H^{++} only couples to $e^+\mu^+$ with $g_{e\mu}=0.3$ (electromagnetic strength), a limit $m_{H^{++}}>141$ GeV (95% CL) is derived. For the case where H^{++} couples to $e\tau$ only the limit is 112 GeV
- the limit is 112 GeV.
 13 ACOSTA 05L search for $H^{++}H^{--}$ pair production in $p\overline{p}$ collisions. The limit is valid for $g_{\ell\ell'} < 10^{-8}$ so that the Higgs decays outside the detector.
- ¹⁴ ABAZOV 04E search for $H^{++}H^{--}$ pair production in $H^{\pm\pm}\to\mu^\pm\mu^\pm$. The limit is valid for $g_{\mu\mu}\gtrsim 10^{-7}$.
- ¹⁵ ABBIENDI 03Q searches for single $H^{\pm\pm}$ via direct production in $e^+e^- \rightarrow e^\mp e^\mp H^{\pm\pm}$, and via t-channel exchange in $e^+e^- \rightarrow e^+e^-$. In the direct case, and assuming B($H^{\pm\pm} \rightarrow \ell^\pm \ell^\pm$) = 1, a 95% CL limit on h_{ee} < 0.071 is set for $m_{H^{\pm\pm}}$ < 160 GeV (see Fig. 6). In the second case, indirect limits on h_{ee} are set for $m_{H^{\pm\pm}}$ < 2 TeV (see Fig. 8).
- ¹⁶ GORDEEV 97 search for muonium-antimuonium conversion and find $G_{M\overline{M}}/G_F < 0.14$ (90% CL), where $G_{M\overline{M}}$ is the lepton-flavor violating effective four-fermion coupling.

This limit may be converted to $m_{H^{++}} >$ 210 GeV if the Yukawa couplings of H^{++} to ee and $\mu\mu$ are as large as the weak gauge coupling. For similar limits on muonium-antimuonium conversion, see the muon Particle Listings. ¹⁷ ACTON 92M limit assumes $H^{\pm\pm} \rightarrow \ell^{\pm}\ell^{\pm}$ or $H^{\pm\pm}$ does not decay in the detector. Thus the region $g_{\ell\ell} \approx 10^{-7}$ is not excluded.

- $^{18}\,\mathrm{ACTON}$ 92M from $\Delta\Gamma_Z$ <40 MeV.
- 19 SWARTZ 90 assume $H^{\pm\pm}\to\ell^\pm\ell^\pm$ (any flavor). The limits are valid for the Higgs-lepton coupling g(H\$\ell\$\ell\$) $\gtrsim 7.4\times10^{-7}/[m_H/\text{GeV}]^{1/2}$. The limits improve somewhat for ee and $\mu\mu$ decay modes.
